

The JAPA skidding grapple is gentle on the forest yet robust for skidding, transport and stacking of logs.

The JAPA skidding grapple is the right tool for efficient skidding and the close-range transportation of logs. Together with the counter bolster, the three claws straighten the logs, which speeds up the transport and stacking operations. Owing to the articulated frame of the skidding grapple, the load follows the tractor's movements, causing no damage to the growing tree stand. The articulated joint can be locked from the cabin.

The hydraulic swing to the side, which is available as an option, makes picking up of bunches from the drive track easier. The wide spread of the claws and the strong cylinder ensure good penetration of the claws into the woodpile.

Technical data:

Number of claws	3 pcs.
Cylinder diameter (double-acting)	60 mm
Pinching force at the claw tip	1000 kg
Max. gap between the claws	2000 mm
Length of the boom – from the middle of the claw to the joint pin	1100 mm
Weight	235 kg
Optional: Swing cylinder	
• Double-acting	
• Angle of rotation of 45 degrees	
• Weight 15 kg	

All JAPA products carry a warranty of 1 year.
