

KRONOS

Forest

ENG

The **Kronos 8020 series** is available with option of three different boom lengths. This is the most powerful crane in the Kronos range, they are extremely robust and after rigorous testing they have proved their structural superiority.

The 8020 series cranes' lifting and slewing forces are high throughout the whole operating envelope therefore guaranteeing high efficiency. The 8020 series of cranes comes as standard with a powerful grapple and rotator.

Two particular sectors have been especially focused on when developing the Kronos 8020 series of cranes: durability and ergonomics. The booms have passed detailed FEM analyses and demonstrated their enormous strength. The slewing and lifting dampers soften the movements and prevent sharp hydraulic pressure peaks in loading, therefore extending the crane's service life. The telescopic extension cylinder with hydraulic end-dampening and swing damper for the grapple put final touches to the unit.

Kronos 8020 is suitable for mounting on large tractors and forestry trailers, e.g. Kronos 140 4WDM and 160 4WDM.

Kronos 8020L + Valtra N123

Kronos 8020 L

Kronos 8020

Kronos 8020

KRONOS 6020 is designed in accordance with the wishes of professional users. The sturdy crane booms and high quality hydraulic components guarantee many working hours for the years ahead.

Hydraulic hoses are well shielded inside a protective cover. The hoses are dimensioned for large amounts of oil flow to the grapple. This enables the efficient use of various felling and energy grapples without further modifications.

Kronos 6020 is suitable for mounting onto large tractors and forestry trailers, for example to the Kronos 140 4WDM & 160 4WDM.

Kronos 6020's powerful slewing device, short lift boom, and strong chain-transmission-based double extensions, together make transportation of heavy loads extremely accurate and fast.

There are various alternative control systems for the crane. For the professional contractor a hydraulic or electrical remote control system is an advisable alternative. The greatest output in professional use can be reached by a fully electronic CAN bus controlled valve. The system enables, among other things, individual speed control of all the motions.

Kronos 6020 L

Kronos 6020 L

Kronos 6020

Kronos 6020 L

Kronos 6020

The new Kronos 5020 series is a new addition to the already comprehensive range of Kronos forestry machinery. The starting point for the design of the machine was a desire to develop a loader that had a chassis that was both durable and light. We achieved both of these objectives and we are now able to proudly present the perfect loader for any tractor use. Two basic models are available, which we can tailor to meet the needs of our customers.

The loader's booms have been completely redesigned, with the hoses leading to the grapple being securely housed within the boom itself. A significant weight decrease has also been achieved with the internalization of the hoses, adding to the efficiency of the loader. Two basic models are available, which we can tailor to meet the needs of our customers.

This model with the 2,7m main makes it a very versatile tractor-mounted loader for fitting direct to the tractor (via a Jake Mounting kit) Thanks to compact 1st main boom the use with an energy grapple is very efficient also making the loader very agile in first thinnings.

The 5020L loader is ideal for mounting on a trailer. The long main boom enables good reach for timber in most situations and enables you to stack high loads on a trailer.

Kronos 5020

Kronos 5020

Kronos 5020

The Classic Professional's Crane

Kronos 5000 has acquired a vast and faithful body of end users. Its high lifting force, optimised motion paths and short main boom make the 5000 an extremely agile and productive crane for thinning operations.

With two hydraulic extensions, it has a maximum reach of 7.5 metres, despite the crane's short main boom (2.6 metres).

The crane has been designed using the highest quality materials, well dimensioned bearings and cylinders developed for intensive work. High quality hoses ensure little downtime and trouble free operations.

Models L = 8,3 m, XL = 8,8 m and XXL = 9,8 m are recommended for purposes requiring long reach.

Kronos 5000 XXL

Kronos 5000, Valtra N92, harvester head

Kronos 5000, Eschlböck Biber 80 chipper

Kronos 5000 XXL

The Kronos 4000 has been developed for users who know that quality always pays in the end. Providing the best alternative to a Kronos trailer and/or an agricultural tractor, where the crane makes the difference.

The Kronos 4000 and its unique design solutions are inspired by our larger cranes. It is therefore also based on what the professional demands with quality down to the finest detail: bearings, hosing, hydraulics and high quality materials provide the perfect complement!

The Kronos 4000 is available with max. reach: 6,6 m or 7,1 m with either two or four turning cylinders. Various valve options can be supplied.

Kronos 160 4WDM

The **KRONOS 140 4WDM/160 4WDM** forestry trailers have a sturdy set of bogey axles based entirely on mechanical transmission, with the power generated by the drive shaft being transmitted via a drive gear and a differential gear system to the bogie housings on both sides of the machine.

The 140 trailer comes with either an articulated drawbar or with a Y-drawbar. The Y-drawbar has an atomized frame lock which makes support legs unnecessary. With this drawbar, the trailer follows tractor path automatically. It comes also with frame steering cylinders that improve maneuverability in difficult situations. Normally these cylinders are in floating. The 160 trailer have always the Y-drawbar. Road safety is guaranteed via multiple-disc brakes.

A standard feature of the drive gear is its differential gear lock, which enables all four wheels to pull at the same speed. The trailer's set of drive shafts is provided with an overload clutch to deal with inadvertent overloading. The gear ratio between the tractor and the trailer has been adapted in the trailer's front-end gearbox, the gear ratio of the trailer being variable by changing a pair of gear wheels or the entire gearbox.

When the trailer is being pulled with the power transmission off, the set of drive shafts is disengaged, freeing the front-end gearbox from unnecessary rotation, and thus making the trailer easier to pull.

Y-tractor axle drawbar with hydraulic locking and frame steering (with 2 cylinders)

Kronos 140 4WDM

A good forestry trailer is the sum of many factors. Having listened to its customers, Kronos has developed a new model called Kronos 150 H / 4WD. Product development gave birth to a robust trailer with a frame based on enclosure-beam structure. The trailer is structurally capable of carrying a heavy-duty loader along with a large load of timber. Wide tyres, powerful hydraulic drawbar steering using two cylinders and hydraulically driven wheels (in 4WD model) ensure good operation even in difficult terrain.

In the 4WD model the power is transmitted to the wheels by means of rollers forced against the tyres. The hydraulic motors with the rollers get the oil flow from the tractor hydraulic output or from a separate pump unit. This extra traction is used only in difficult situations.

The operator just switches the traction on from using a control valve and switches it off when the tractor reaches a higher speed and is able to pull the trailer under its own power. In most situations, a tractive force of 1600 kp is enough to prevent the unit from getting stuck. The design of the roller keeps it clean and ensures a very good grip to the tyres. The large load space provides the trailer with real capacity even for long forwarding distances. Safety when driving along roads is ensured by powerful brakes and high quality lights and reflectors. Kronos 150 H trailers are well equipped to meet the demands of a variety of end users. The trailer is also available without the base for a loader.

Tractive force 1600 kp with an oil pressure of 175 185 bar
Speed 3 km/h with an oil flow of 60 litres/min.
Speed 4 km/h with an oil flow of 80 litres/min.

Kronos 150/150 4WD

Models 100 H, 120 H, 100 4WD, and 120 4WD are dualbeamed. This has made it possible to keep the trailer frame structure low and the trailer's centre of gravity low also when carrying a load. The sturdy structure of the trailers is able to accommodate even the heavier crane models.

The trailers can be customised to fulfil the individual needs of users. Kronos forestry trailers include various crane mounting options and hydraulic systems. The trailers can be provided with extra bolsters, tractor mountings, and brake systems, which can be adapted to meet the varying requirements of different countries.

The 4WD models provided with hydraulic transmission. The power is transmitted to the tyres by means of rollers forced against the tyres by means of hydraulic cylinders. The wheels can be provided with separate brakes. Their tractive force is approx. 1600 kp.

Kronos 6020 and harvester head

Farmers harvesting their own timber harvest in their woodlands are common in the Scandinavian countries. Using specialized logging attachments on modified farm tractors, they often log during the winter when their normal farming operations are suspended. The smaller, lighter farm tractor may be able to operate effectively on partial cuts in dense timber stands where larger skidders or forwarders might possibly cause residual stand damage or soil compaction. A farm tractor logging system, with its relatively low capital investment and operating costs, may be an effective way to meet other non-timber landowner objectives that require logging small areas infrequently, like clearing wildlife plots or opening up recreation areas. Finally, farm tractor logging can be a very effective system for producing firewood from the farm woodland for personal consumption or commercial sale.

Kronos 6020 adapts to the user's needs in various operating situations. The crane's power and optimised boom dimensions make it an excellent crane also for logging purposes. Well-shielded hydraulic hoses and the preciseness of crane controls ensure that the operator can focus fully on getting the job done.

Front axle locking unit set for Valtra tractors without air-suspended axle. Set consists of two cylinders, hoses and valve.

Mounting kits for tractor frame (Jake)

Additional hydraulic units (front pump-units)

Front pump equipment is specifically designed for use in forest. Robust construction, good protection and effective filtering will give trouble-free operation in the woods. We only use the best quality piston load sensing pumps to give reliable long-life operation. Use of load sensing pumps ensures better fuel economy, high oil flow and full pressure is reached with very low engine speeds.

Turning moment for models 4000 and 4000L increases to 15,3 kNm by using additional turning cylinders.
#Attention! Only if the crane is equipped with two extra turning cylinders.

Kronos aims to offer efficient and profitable solutions to its customers as the result of the company's design and production efforts. Kronos designs and manufactures forestry cranes and trailers, forestry harvesters, and various implements for tractors (e.g. hydraulic units, crane accessories, front-axle stabilising units, operating valve units).

Part of the company's production goes to contractors and includes customised products meeting specific needs of individual contractors. The hydraulic components are of the highest standard and we use high-quality Scandinavian steel.

The design and product development implemented is all the result of in-house engineering experts' efforts. We hold customer contacts in great esteem.
